

Why a One-Month Periodontal Recare Visit?

Your Soft Tissue Management Program is a non-surgical approach to control periodontal disease. There is no cure for periodontal disease; it can only be controlled.

Following your scaling and root planing appointment, it is critical to re-evaluate the healing process. There might be a need for additional treatment. We will remove stain or calculus that may have occurred with the use of chlorhexidine. We will be tailoring your home care regimen, including but not limited to discontinuance of chlorhexidine and implementation of Breath Rx and a fluoride.

This will be an opportunity for questions regarding your care.

Your next visit will be in three months. Keep up the great work!
